If your computers are relatively close together and the file is quite small it may be quickest to send the file over a serial cable connected to serial port on each computer.

NET implementation fails in this connection because you need to invest time in developing thread security in your data structures so that events running in the thread pool context will not harm things.. I can guarantee that I will send serial string within 15ms but the host will not get it for 80ms and sometimes as much as ms Which external power causes this delay.. With the code above as soon as I connect to serial port memory increases usage and the program stops responding and I have to stop debugging.. I guess if you base your complaints on your experience you should probably learn to create professional programs and not accuse the technique.

The device is a slave and your PC is a master Request-Response Mode My Suggestion: If you only use a button you must use a global variable of integer type.. Mark Parity simply sets the parity bit to logically high and Space puts the parity bit to logic low so that the recipient can determine if the data is corrupted.. In my version the incorrect events should work NET versions are deployed if the software gets to full speed on serial port which makes it likely that the data will continue to arrive during event processing the software should run on a variety of computers and even when the CPU is hungry. Due to the small buffer size and the lack of hardware flow control i e no code to be implemented hardware handheld to control the article does not provide a high performance code for transferring data from one computer to another.. Obtaining these skills often begins at a young age before the students focus on pressure-based concepts such as tone-symbol correspondence and
